

JSS 2 TRADE SUBJECT – FIRST TERM

COMPUTER HARDWARE AND GSM REPAIRS

1. Review of Hardware and Safety

Identify main PC parts: motherboard, CPU, RAM, storage (HDD/SSD), power supply, and peripherals. For phones: battery, screen, charging port, board. Safety: discharge static, disconnect power, use correct tools, avoid liquid damage and forced parts.

2. Tools and Workshop Practice

Screwdrivers, tweezers, multimeter, soldering iron (under supervision), anti-static wrist strap, opening tools for phones. Organise screws and parts; work on a clean, well-lit bench; document steps for reassembly.

3. Common PC Problems and Checks

No power, no display, slow performance, overheating. Basic checks: power cable and supply, RAM seating, storage connections, dust cleaning, and simple software checks (under guidance). Replace only when diagnosis is clear.

4. Common GSM (Phone) Issues

Charging faults, cracked screens, speaker/mic problems, software freezes. Learn careful opening, connector handling and battery safety. Software: basic recovery and update concepts; avoid unofficial “cracks” that harm security.

5. Customer Service and Entrepreneurship

Listen to the complaint; give honest estimates; protect customer data; return devices in good condition. Quality repairs and fair pricing build a repair business.

Summary

JSS 2 Hardware and GSM Repairs focuses on identification, safe dismantling, common faults and professional repair habits for PCs and mobile phones.
