

JSS 2 TRADE SUBJECT – FIRST TERM

HORTICULTURE AND CROP PRODUCTION

1. Review of Horticulture Basics

Horticulture is the science and art of growing fruits, vegetables, flowers and ornamental plants. Crop production focuses on raising crops for food and income. Soil, water, light and nutrients determine success.

2. Soil Preparation and Nursery Practice

Clear land, till and improve soil with organic matter where possible. Raise seedlings in a nursery for transplanting; harden seedlings before field planting. Use clean seed and healthy planting materials.

3. Planting and Spacing

Follow recommended spacing and depth for each crop. Timing (season, rainfall) affects establishment. Label beds and keep simple records of what was planted and when.

4. Watering, Weeding and Nutrient Care

Water adequately without waterlogging. Control weeds by hand or safe methods. Apply fertiliser or manure according to crop need; avoid over-application that wastes money and harms the environment.

5. Pest and Disease Awareness

Observe crops regularly. Use cultural methods (crop rotation, sanitation) first; apply chemicals only when necessary and with care for safety and the environment. Seek advice for serious outbreaks.

6. Harvesting and Entrepreneurship

Harvest at the right stage for quality and shelf life. Grade and package attractively. Plan what to grow for local demand; cost inputs and set prices that cover costs and reward labour.

Summary

JSS 2 Horticulture and Crop Production develops practical skills in soil, nursery, planting, care, pest awareness and basic agribusiness thinking.
